Abstract

Bangladesh is an agricultural country and most of the farmers in our country is uneducated also they don't know how to access the facility of digital system. The farmers of our country are really hard worker, be it sunny or rainy they had to work in their fields. We developed our project "Farm-ware" to make their life easy and also we kept our app simple so that they can access it easily. Our project is mainly a smart farming based app, we can implement this in a particular area to get the information of the atmosphere as well as the growth rate of the plants of that area.

Acknowledgement

We would like to Thanks our faculty, **Dihan Md. Nuruddin Hasan** sir to give us this opportunity to do this project on “**Farm-Ware**”. It was really a good opportunity for us because we got to learn so many new things which will be very useful for us. Also we would like to thank our friends who helped us to know more about this project and our group members, who were very dedicated and active.

Introduction

We have done the project farm-ware to make it easy for the people to get enough information about the temperature, humidity, soil moisture etc. of a particular area. Bangladesh is an agricultural country. But maximum number of our farmers are uneducated. So they can't access the facility of the digital services related to agriculture using smart devices. Project Farm-Ware is based on this context to provide information collected by Hardware tools and served by easy interface presenting the information only. Farm ware is also included with website and smartphone application to spread the collected information. The hardware part is going to build by using micro controller and sensors. The information will be about the temperature, soil moisture, humidity, water flow and water level, pesticides, plant growth etc. The information will be presented on spot by the device. Information will also be stored in the cloud. The information can be accessed through our app easily and simply. We have also implemented machine learning using our sensors data. Which will determine the growth rate of the plants. Most of the people in this country is depended on agriculture and that is why keeping this in mind we developed this project to make farming easier for the people. With the growing adoption of the Internet of Things (IoT), connected devices have penetrated every aspect of our life, from health and fitness, home automation, automotive and logistics, to smart cities and industrial IoT. Thus, it is only logical that IoT, connected devices, and automation would find its application in agriculture and, as such, tremendously improve many facets of the farming practice. The agriculture industry could be further developed by employing new technologies, in particular, the Internet of Things (IoT). Farming has seen a number of technological transformations in the last decades, becoming more industrialized and technology-driven. By using various smart agriculture gadgets, farmers have gained better control over the process of raising livestock and growing crops, making it more predictable and efficient.

Problem Statement

Farming is not an easy job there is a lot to handle and also farmers need to know so many information like what is good for their plant and what is not also they should know about the atmosphere. To provide efficient decision support system using wireless sensor network which handle different activities of farm and gives useful information related to farm field to farmer. As our country is developing, our farming system should also develop. Many farmers lack the knowledge of smart farming and also how to apply technology for their benefit.

The hardware part is going to build by using micro controller and sensors. The information will be about the temperature, soil moisture, humidity, water flow and water level, pesticides, plant growth etc.

The information will be presented on spot by the device. Information will also be stored in our database. To show the information we will use smartphone applications

Proposed Solution

Our solution in this situation is creating Farm-Ware. It will save time and toil both. Also it is a low cost project so that the farmers can implement it on their land and can get the information easily and quickly. Our solution has some attractive features like:

1. Low cost to implement the whole system.
2. Simple design.
3. Easy to implement.
4. Easy to install the app.
5. Easy to use.
6. Data is stored directly.
7. Stored data can be access easily.

In its simple form, our system consists of some sensors to get the data's from the atmosphere. The whole system will look like this:

Fig. Picture of the whole project.

The sensors will be placed in the particular area like this and also we will implement a camera which will take pictures of the plants to show the growth rate of the plants. The whole thing will be connected with the app, so that all the data's will be visible on the app.

This system will create a great impact on uses of daily life of the farmers as it will reduce their toil and time. Also it will be very useful for a large farming area.

Our system will work like the following work flow:

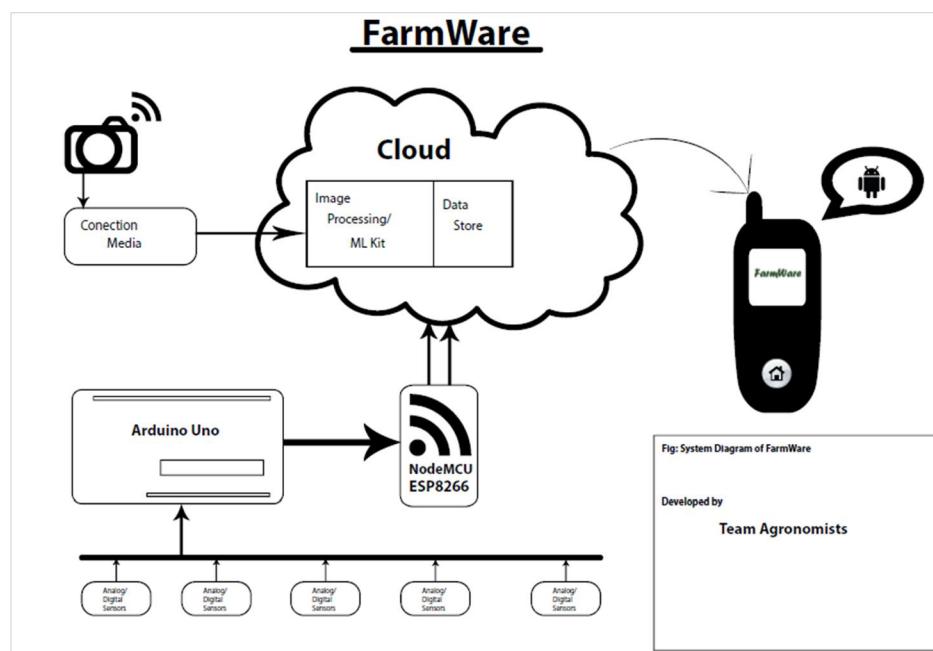

Fig. : System diagram

The farm-ware app is also designed to keep it as simple as possible. This will help the farmers to look after their crops from their home. They can see the crop growth and also get the respected data's through the app.

The approach of the app is given below:

Front-end plan

A total of 8 page-templates in plan

1. Main page
2. Search result page
3. Location page
4. Agricultural data page
5. Advice page
6. Register/login page
7. Farmer profile creation page (all steps 1,2,3 as one)
8. Agricultural officer's details page

Map layout on search results will be visible and this will use Google API.

Back end development

1. Account Creating, Password Recover:
 - a. Sign up form, verification by mobile or email.
 - b. Login
 - c. Forgot Password
 - d. MySQL Database
 - e. Google sign in
2. Profile Management:
 - a. DB plan design
 - b. User Profile
 - c. Profile of agricultural officer
 - d. Others
3. Searching facility:
 - a. Location based
 - b. Data search

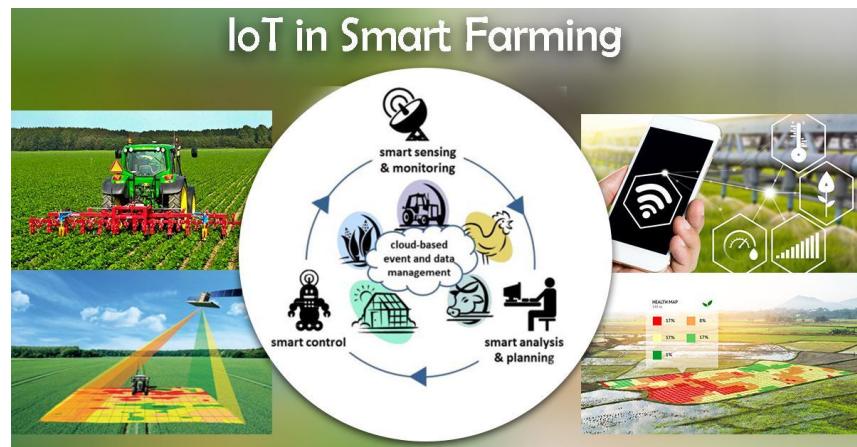

Related work

Smart farming is now a days most popular among the farmers of the developed country. Some of the related works of smart farming based on IoT are as follows:

a. Precision Farming

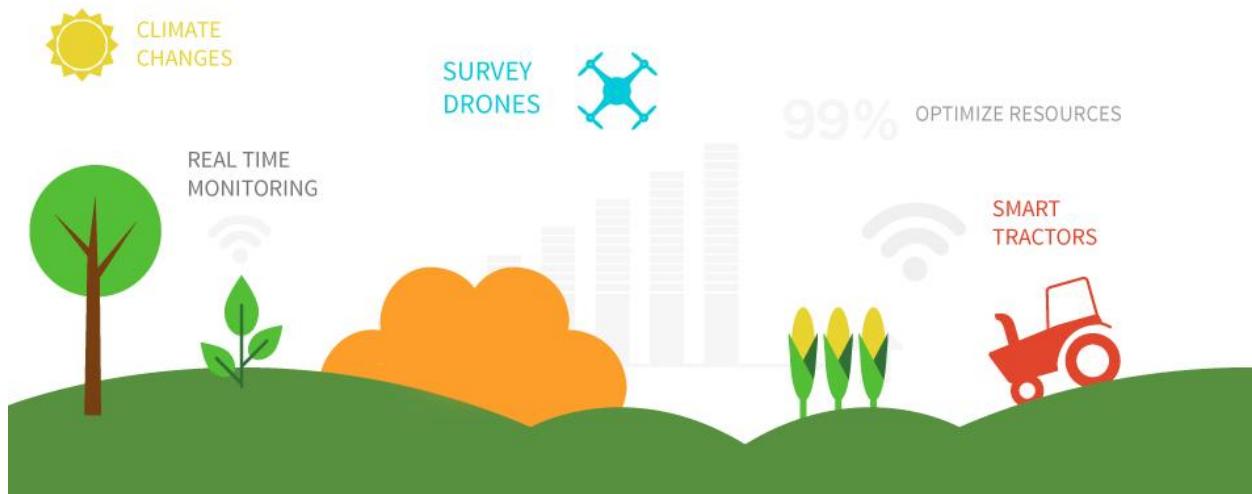

Precision farming is a process or a practice that makes the farming procedure more accurate and controlled for raising livestock and growing of crops. The use of IT and items like sensors, autonomous vehicles, automated hardware, control systems, robotics, etc in this approach are key components.

Precision agriculture in the recent years has become one of the most famous applications of IoT in agricultural sector and a vast number of organizations have started using this technique around the world. The products and services offered by IoT systems include soil moisture probes, VRI optimization, and virtual optimizer PRO, and so on. VRI (Variable Rate Irrigation) optimization is a process that maximizes the profitability on irrigated crop fields with soil variability, thereby improving yields and increasing water use efficiency.

b. Agriculture Drones

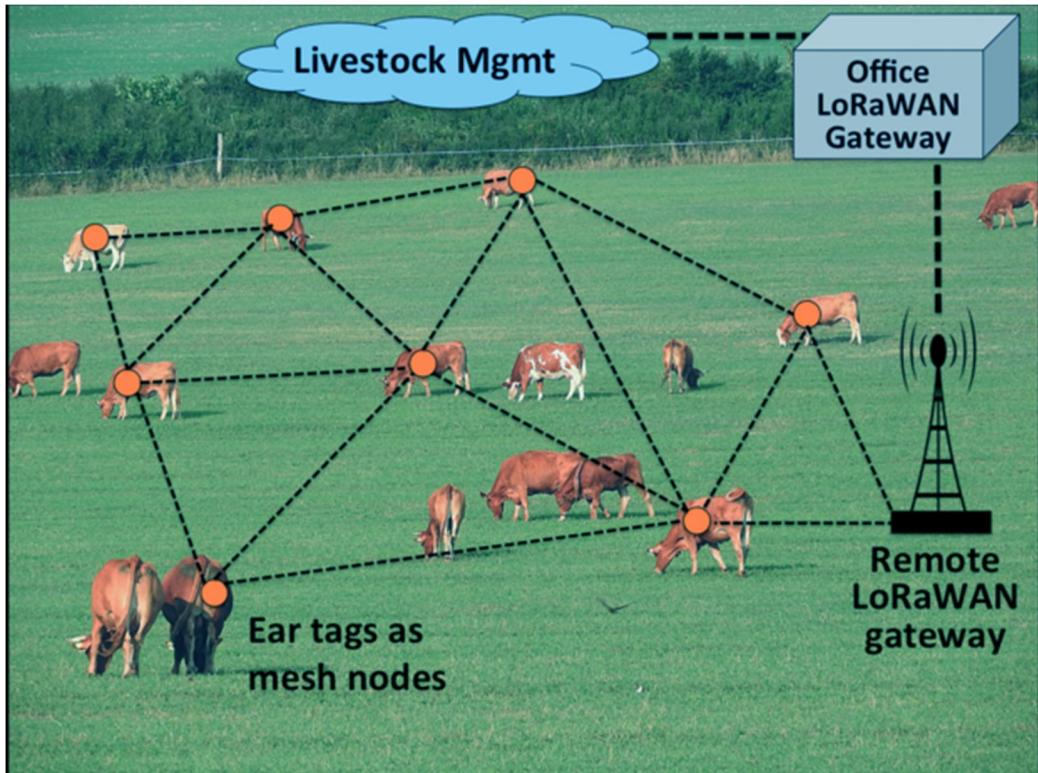

Agricultural drones are a very good example of IoT applications in Agriculture. Agriculture industries today, have become one of the major industries where drones can incorporate. Two types of drones, that is, *ground-based* and aerial-based drones are being incorporated in agriculture in many ways such as, for crop health assessment, irrigation, planting, and soil & field analysis. The benefits that the usage of drones brings to the table include, ease of use, time-saving, crop health imaging, integrated GIS mapping, and the ability to increase yields. The drone technology will give a high-tech makeover to the agriculture industry by making use of strategy and planning based on real-time data collection and processing. The farmers through drones can enter the details of what field they want to survey. Select an altitude or ground resolution from which they want data of the fields. From the data collected by the drone, useful insights can be drawn on various factors such as plant counting and yield prediction, plant health indices, plant height measurement, canopy cover mapping, nitrogen content in wheat, drainage mapping, and so on. The drone collects data and images that are thermal, multispectral and visual during the flight and then lands at the same location it took off initially.

c. Livestock Monitoring

IoT applications help farmers to collect data regarding the location, well-being, and health of their cattle. This information helps them in identifying the condition of their livestock. Such as, finding animals that are sick so, that they can separate from the herd, preventing the spread of the disease to the entire cattle. The feasibility of ranchers to locate their cattle with the help of IoT

based sensors helps in bringing down labor costs by a substantial amount. One example of an IoT system in use by a company is JMB North America. Which is an organization that provides cow monitoring solutions to cattle producers? Out of the many solutions provided, one of the solutions is to help the cattle owners observe their cows that are pregnant and about to give birth. From them, a battery that is sensor powered is expelled when its water breaks. An information is then sent to the herd manager or the rancher. The sensor thus enables farmers will more focus.

Technical approach

The equipment's that we used to develop our whole system are given below:

1. Arduino Uno board
2. Temperature sensor
3. Humidity sensor
4. Water level sensor
5. Water flow sensor
6. Raindrop sensor
7. Soil moisture
8. Bread-Board
9. NodeMCU ESP8266 Module
10. Wires
11. Android app studio for the app
12. Firebase for storing data
13. Arduino IDE
14. Codelab
15. Python

Hardware Part:

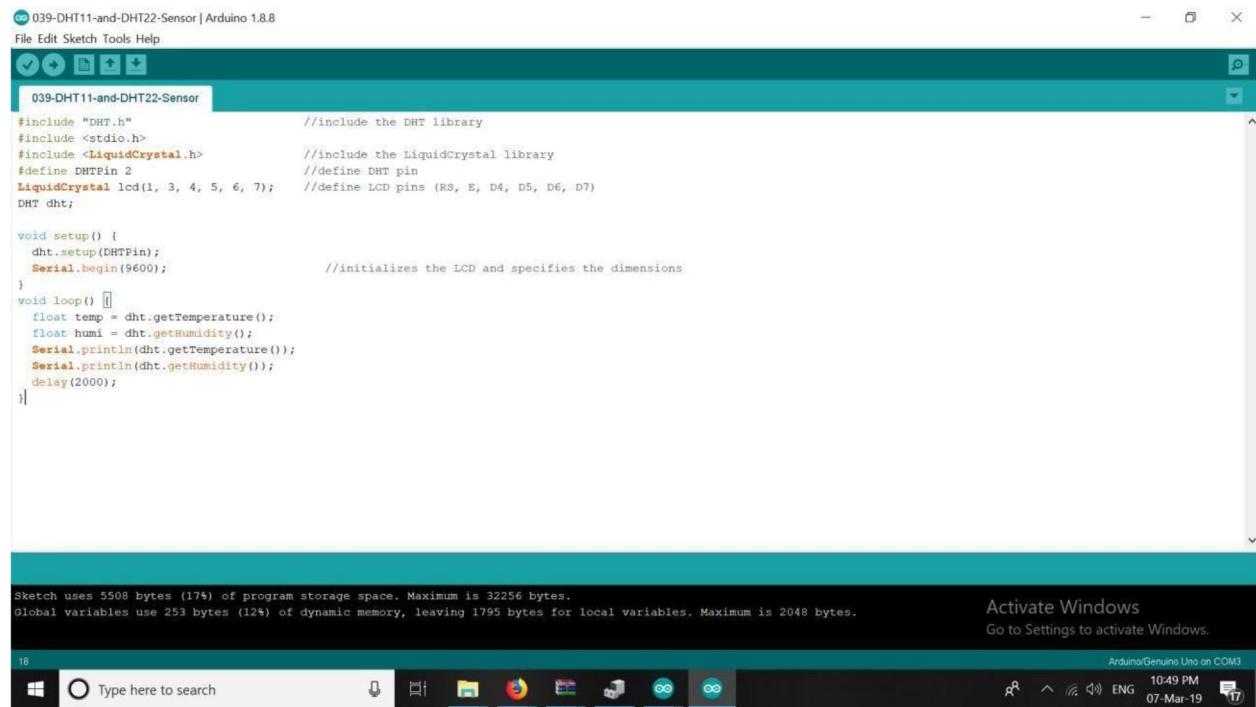

Temperature and Humidity sensors:

We have used Arduino for our project and also done the coding that will detect the temperature and humidity of the atmosphere using DHT22 temperature and humidity sensor.

Code:

```
#include "DHT.h" //include the DHT library
#include <stdio.h>
#include <LiquidCrystal.h> //include the LiquidCrystal library
#define DHTPin 2 //define DHT pin
LiquidCrystal lcd(1, 3, 4, 5, 6, 7); //define LCD pins (RS, E, D4, D5, D6, D7)
DHT dht; void
setup() {
dht.setup(DHTPin);
Serial.begin(9600); //initializes the LCD and specifies the dimensions
}
void loop() {
float temp = dht.getTemperature(); float
humi = dht.getHumidity();
Serial.println(dht.getTemperature());
Serial.println(dht.getHumidity());
delay(2000);
}
```

Arduino IDE snap:

The screenshot shows the Arduino IDE interface with a sketch titled "039-DHT11-and-DHT22-Sensor". The code includes headers for DHT.h, stdio.h, and LiquidCrystal.h, defines pins for DHT and LCD, and sets up the serial port. The loop prints temperature and humidity to the serial monitor every 2000ms.

```
#include "DHT.h" //include the DHT library
#include <stdio.h>
#include <LiquidCrystal.h> //include the LiquidCrystal library
#define DHTPin 2 //define DHT pin
LiquidCrystal lcd(1, 3, 4, 5, 6, 7); //define LCD pins (RS, E, D4, D5, D6, D7)
DHT dht;

void setup() {
  dht.setup(DHTPin);
  Serial.begin(9600); //initializes the LCD and specifies the dimensions
}

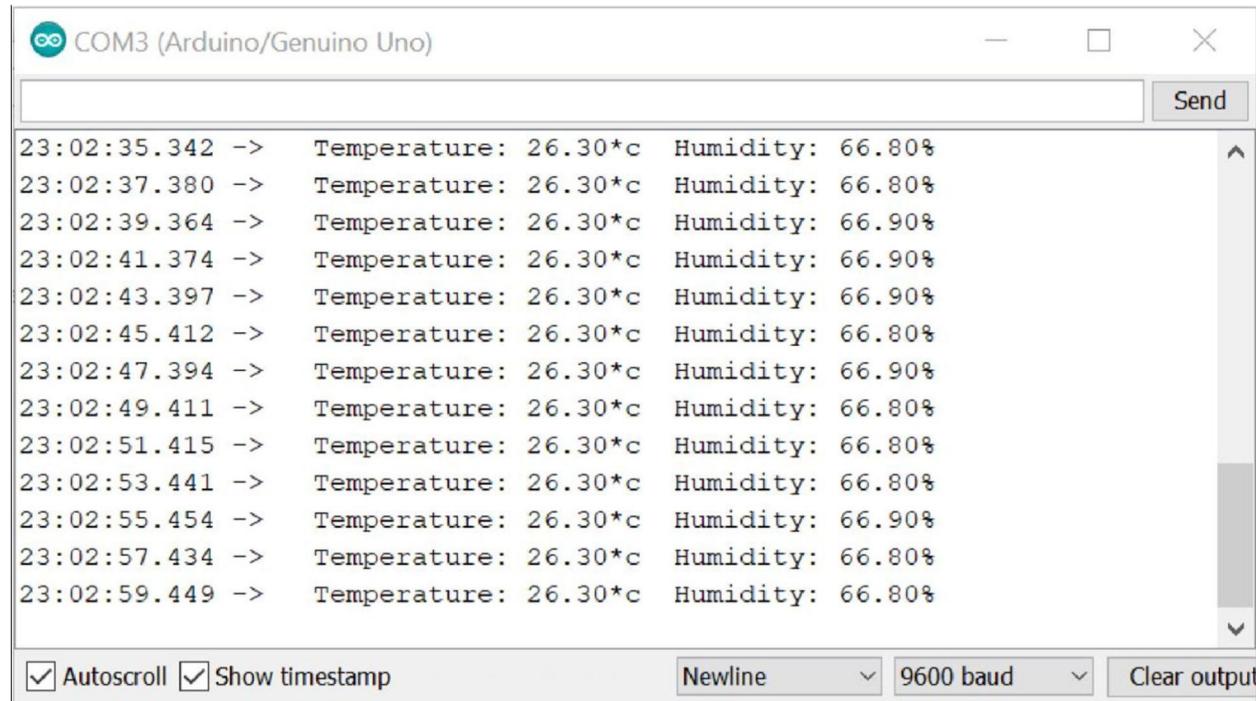

void loop() {
  float temp = dht.getTemperature();
  float humi = dht.getHumidity();
  Serial.println(dht.getTemperature());
  Serial.println(dht.getHumidity());
  delay(2000);
}
```

Sketch uses 5508 bytes (17%) of program storage space. Maximum is 32256 bytes.
Global variables use 253 bytes (12%) of dynamic memory, leaving 1795 bytes for local variables. Maximum is 2048 bytes.

Circuit:

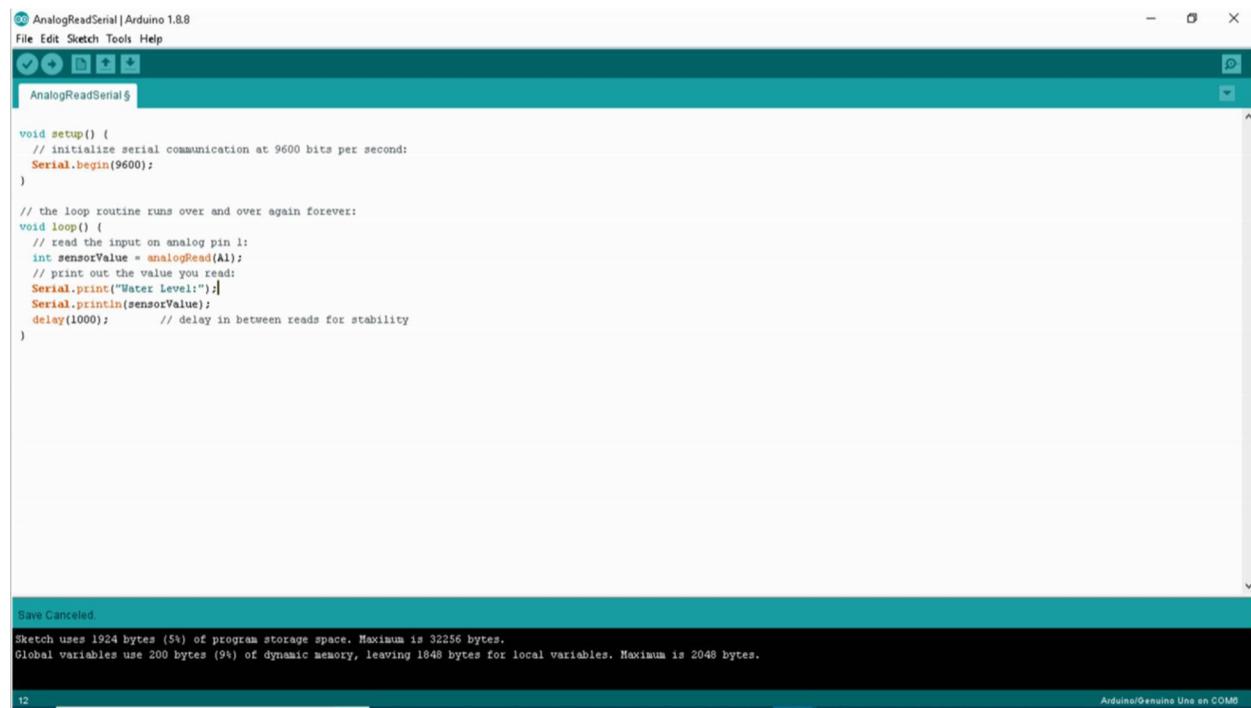

Water Level Sensor:

Water level sensor is used to measure the level of water of a particular area.

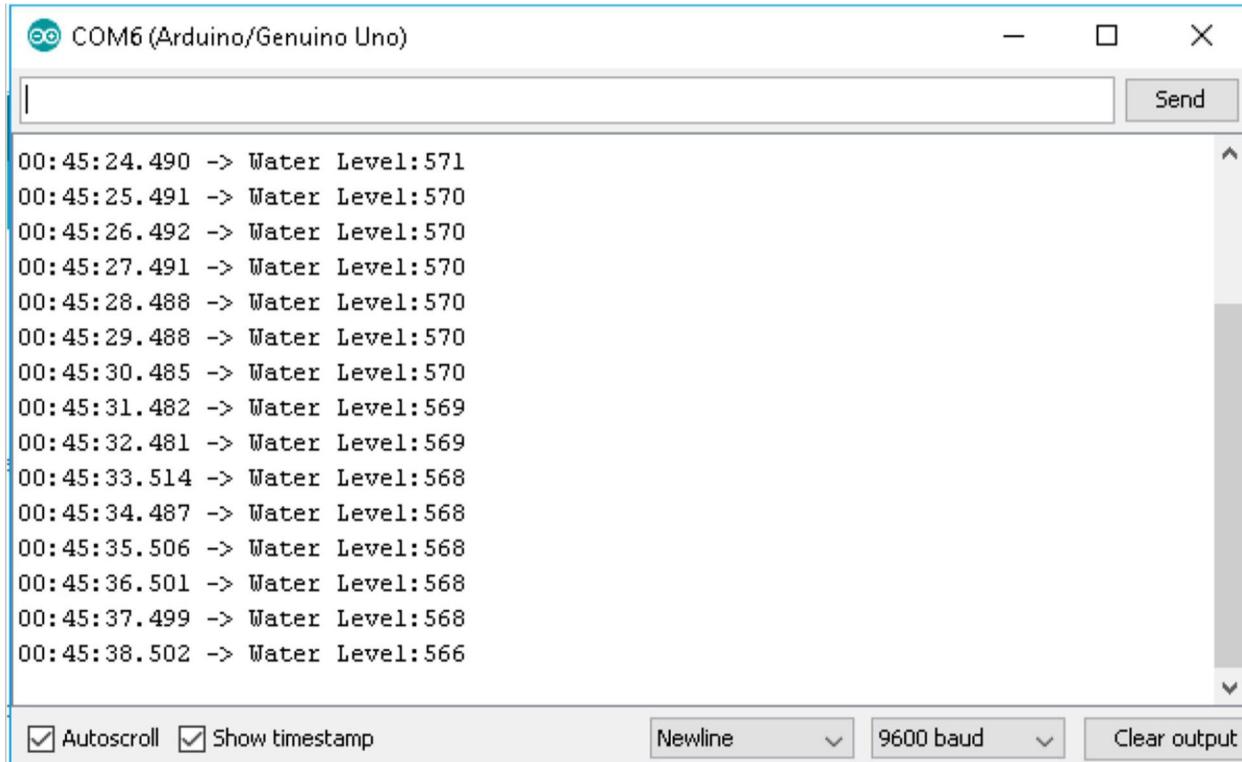

Code:

```
void setup() {  
// initialize serial communication at 9600 bits per second:  
Serial.begin(9600);  
}  
// the loop routine runs over and over again forever:  
void loop() {  
// read the input on analog pin 1: int sensorValue  
= analogRead(A1);  
// print out the value you read:  
Serial.print("Water Level:"); Serial.println(sensorValue); delay(1000);  
// delay in between reads for stability  
}
```

Arduino IDE snap:

Serial Monitor Snap:

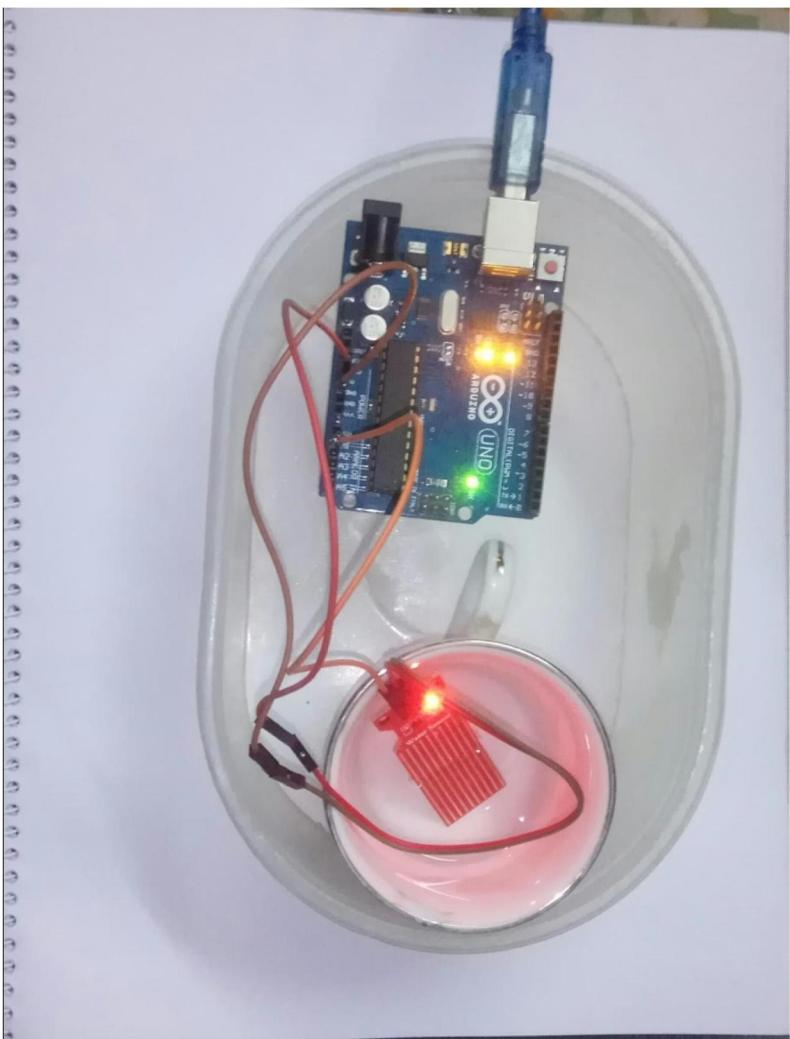

The screenshot shows the Arduino Serial Monitor window titled "COM6 (Arduino/Genuino Uno)". The main area displays a series of timestamped messages: "00:45:24.490 -> Water Level:571", "00:45:25.491 -> Water Level:570", "00:45:26.492 -> Water Level:570", "00:45:27.491 -> Water Level:570", "00:45:28.488 -> Water Level:570", "00:45:29.488 -> Water Level:570", "00:45:30.485 -> Water Level:570", "00:45:31.482 -> Water Level:569", "00:45:32.481 -> Water Level:569", "00:45:33.514 -> Water Level:568", "00:45:34.487 -> Water Level:568", "00:45:35.506 -> Water Level:568", "00:45:36.501 -> Water Level:568", "00:45:37.499 -> Water Level:568", and "00:45:38.502 -> Water Level:566". At the bottom, there are checkboxes for "Autoscroll" and "Show timestamp", a "Newline" dropdown set to "Newline", a "9600 baud" dropdown set to "9600 baud", and a "Clear output" button.

```
00:45:24.490 -> Water Level:571
00:45:25.491 -> Water Level:570
00:45:26.492 -> Water Level:570
00:45:27.491 -> Water Level:570
00:45:28.488 -> Water Level:570
00:45:29.488 -> Water Level:570
00:45:30.485 -> Water Level:570
00:45:31.482 -> Water Level:569
00:45:32.481 -> Water Level:569
00:45:33.514 -> Water Level:568
00:45:34.487 -> Water Level:568
00:45:35.506 -> Water Level:568
00:45:36.501 -> Water Level:568
00:45:37.499 -> Water Level:568
00:45:38.502 -> Water Level:566
```

Autoscroll Show timestamp Newline 9600 baud Clear output

Circuit:

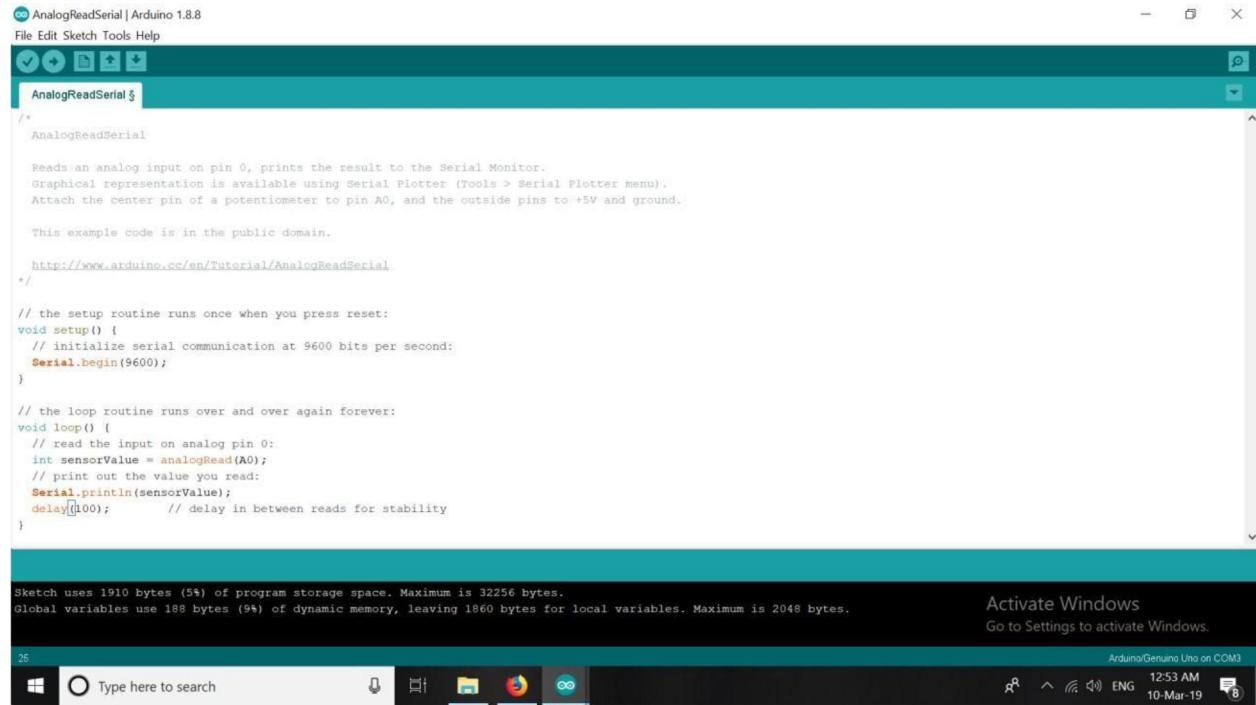

Water flow sensor:

We have used Arduino for our project and also done the coding that will detect the irrigation using Water Flow Sensor.

Code:

```
void setup() {  
// initialize serial communication at 9600 bits per second:  
Serial.begin(9600);  
}  
// the loop routine runs over and over again forever:  
void loop() {  
// read the input on analog pin 0: int sensorValue =  
analogRead(A0); // print out the value you read:  
Serial.println(sensorValue); delay(100); // delay  
in between reads for stability  
}
```

Arduino IDE snap:

The screenshot shows the Arduino IDE interface with the title bar "AnalogReadSerial | Arduino 1.8.8". The menu bar includes File, Edit, Sketch, Tools, and Help. The toolbar has icons for file operations like Open, Save, and Print. The main code editor window contains the "AnalogReadSerial" sketch. The code reads analog input from pin A0 and prints it to the Serial Monitor. It includes setup and loop functions. Below the code, a status message indicates memory usage: "Sketch uses 1910 bytes (5%) of program storage space. Maximum is 32256 bytes. Global variables use 188 bytes (9%) of dynamic memory, leaving 1860 bytes for local variables. Maximum is 2048 bytes." The bottom status bar shows the board as "Arduino/Genuino Uno" connected to "COM3", the baud rate as "1253 AM", the language as "ENG", the date as "10-Mar-19", and a battery icon.

```
/* AnalogReadSerial | Arduino 1.8.8
File Edit Sketch Tools Help
AnalogReadSerial §
/*
AnalogReadSerial

Reads an analog input on pin 0, prints the result to the Serial Monitor.
Graphical representation is available using Serial Plotter (Tools > Serial Plotter menu).
Attach the center pin of a potentiometer to pin A0, and the outside pins to +5V and ground.

This example code is in the public domain.

http://www.arduino.cc/en/Tutorial/AnalogReadSerial
*/
// the setup routine runs once when you press reset:
void setup() {
  // initialize serial communication at 9600 bits per second:
  Serial.begin(9600);
}

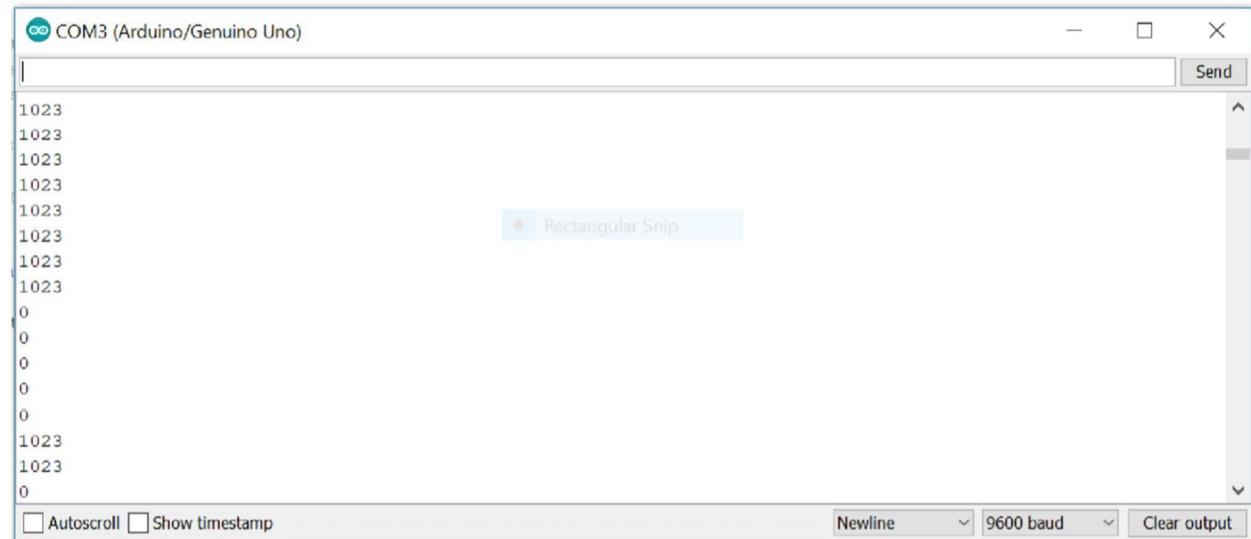

// the loop routine runs over and over again forever:
void loop() {
  // read the input on analog pin 0:
  int sensorValue = analogRead(A0);
  // print out the value you read:
  Serial.println(sensorValue);
  delay(100);          // delay in between reads for stability
}

Sketch uses 1910 bytes (5%) of program storage space. Maximum is 32256 bytes.
Global variables use 188 bytes (9%) of dynamic memory, leaving 1860 bytes for local variables. Maximum is 2048 bytes.

```

Android Application Part:

Through this app data's can be viewed from anywhere. Our software part is done using android studio and firebase. The android app layout and codes are given below:

Splash page:

Code:

The screenshot shows the Android Studio interface with the project 'FarmWare' open. The code editor displays the file 'SplashScreenActivity.java'. The code implements a splash screen that waits for 3 seconds before transitioning to the LoginActivity. The code is as follows:

```
import ...  
public class SplashScreenActivity extends AppCompatActivity {  
    private int SLEEP_TIMER = 3;  
    @Override  
    protected void onCreate(Bundle savedInstanceState) {  
        super.onCreate(savedInstanceState);  
  
        requestWindowFeature(Window.FEATURE_NO_TITLE);  
        getWindow().setFlags(WindowManager.LayoutParams.FLAG_FULLSCREEN, WindowManager.LayoutParams.FLAG_FULLSCREEN);  
  
        setContentView(R.layout.activity_splash_screen);  
  
        getSupportActionBar().hide();  
  
        LogoLauncher logoLauncher = new LogoLauncher();  
        logoLauncher.start();  
    }  
  
    private class LogoLauncher extends Thread{  
        public void run(){  
            try{  
                sleep( millis: 1000 * SLEEP_TIMER );  
            }catch( InterruptedException e){  
                e.printStackTrace();  
            }  
  
            Intent intent = new Intent( packageContext: SplashScreenActivity.this, LoginActivity.class );  
            startActivity(intent);  
            SplashScreenActivity.this.finish();  
        }  
    }  
}
```

Registration page:

Code & Console Design:

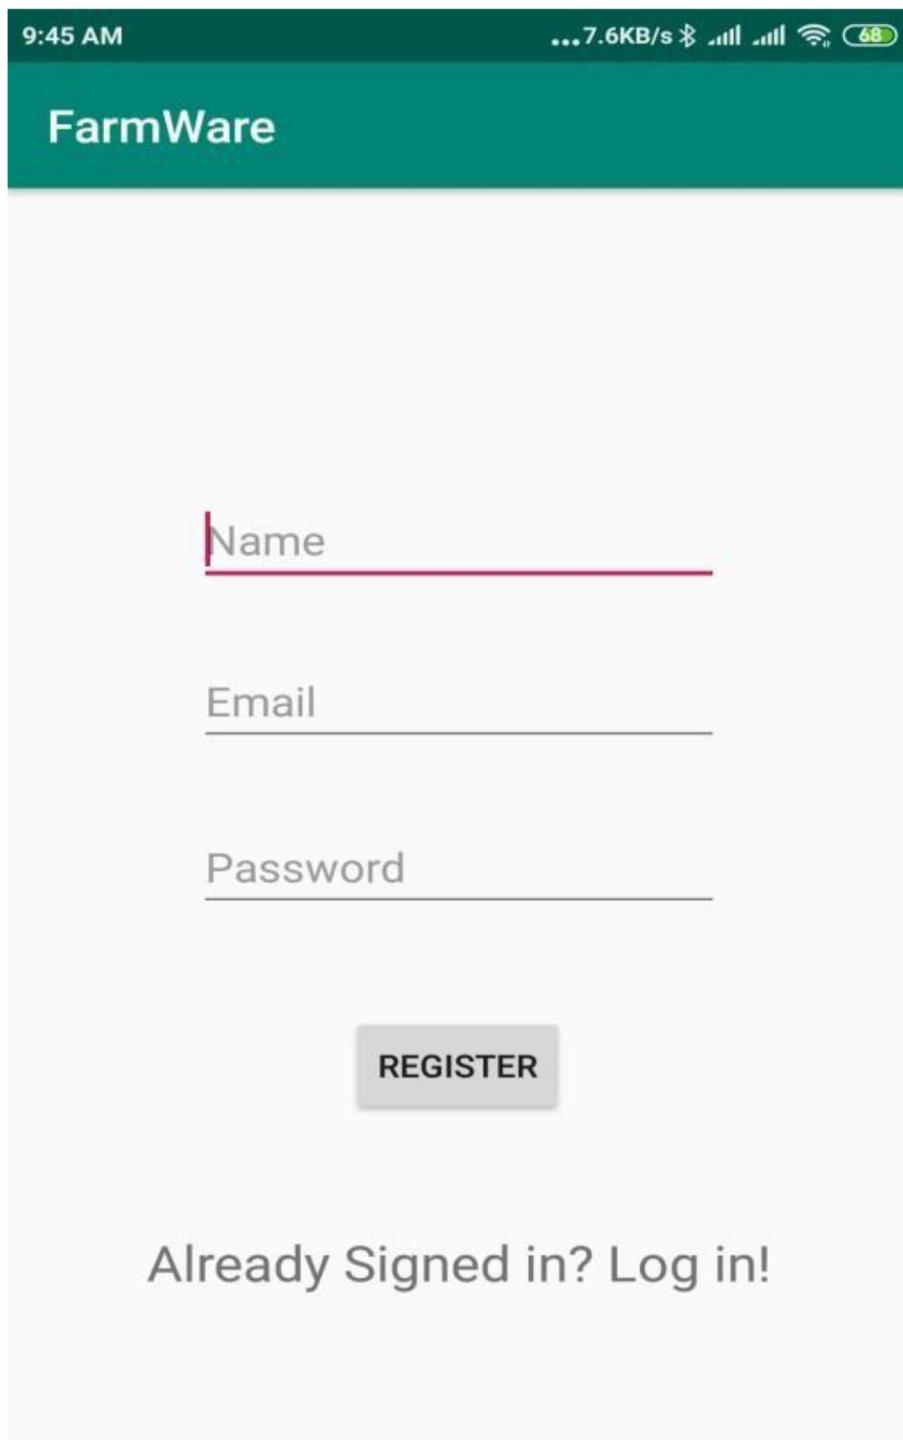

The screenshot shows the Android Studio interface with the project 'FarmWare' open. The code editor displays the `RegistrationActivity.java` file. The code implements a registration logic using FirebaseAuth. It includes methods for validating user input and creating a new user with email and password. The code uses Java 8 features like `Optional` and `CompletableFuture`.

```
1 package com.example.farmware;
2
3 import ...
4
5 public class RegistrationActivity extends AppCompatActivity {
6
7     private EditText userName, userPassword, userEmail;
8     private Button regButton;
9     private TextView userLogin;
10    private FirebaseAuth firebaseAuth;
11
12    @Override
13    protected void onCreate(Bundle savedInstanceState) {
14        super.onCreate(savedInstanceState);
15        setContentView(R.layout.activity_registration);
16
17        setupUIViews();
18
19        firebaseAuth = FirebaseAuth.getInstance();
20
21        regButton.setOnClickListener(new View.OnClickListener() {
22            @Override
23            public void onClick(View view) {
24                if(validate()){
25                    String user_email = userEmail.getText().toString().trim();
26                    String user_password = userPassword.getText().toString().trim();
27
28                    firebaseAuth.createUserWithEmailAndPassword(user_email, user_password).addOnCompleteListener(new OnCompleteListener<AuthResult>() {
29                        @Override
30                        public void onComplete(@NonNull Task<AuthResult> task) {
31                            if(task.isSuccessful()) {
32                                Toast.makeText(context: RegistrationActivity.this, text: "Registration Successful", Toast.LENGTH_SHORT).show();
33                                startActivity(new Intent(packageContext: RegistrationActivity.this, LoginActivity.class));
34                            }else{
35                                Toast.makeText(context: RegistrationActivity.this, text: "Registration Failed", Toast.LENGTH_SHORT).show();
36                            }
37                        }
38                    });
39                }
40            }
41        });
42    }
43
44    private boolean validate(){
45        boolean result = true;
46
47        if(userName.getText().toString().trim().isEmpty()){
48            userName.setError("User Name is required");
49            result = false;
50        }
51
52        if(userEmail.getText().toString().trim().isEmpty()){
53            userEmail.setError("Email is required");
54            result = false;
55        }
56
57        if(userPassword.getText().toString().trim().isEmpty()){
58            userPassword.setError("Password is required");
59            result = false;
60        }
61
62        return result;
63    }
64
65    @Override
66    public void onBackPressed() {
67        finish();
68    }
69}
```

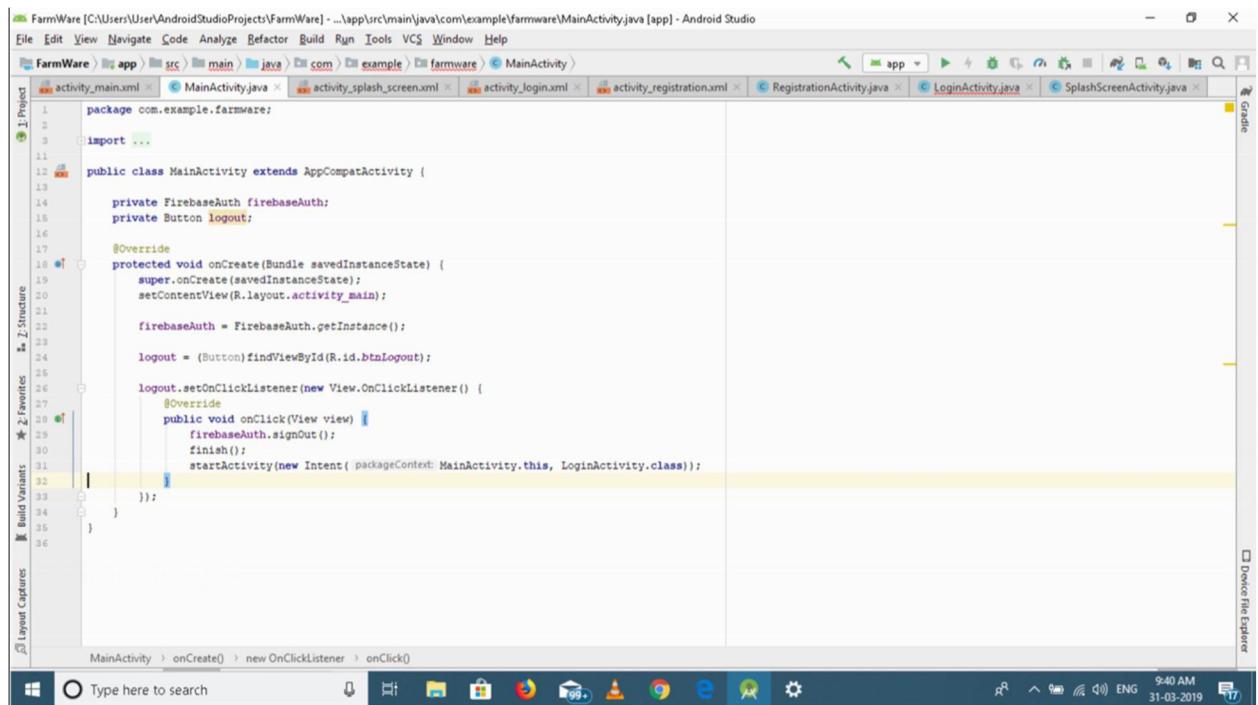

Registration page view:

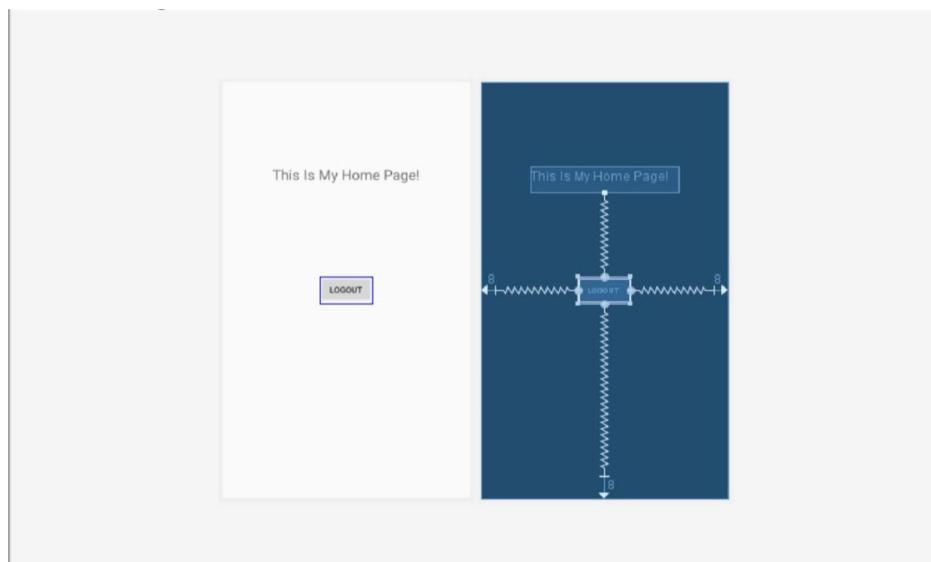

Logout page:

Code & Console Design:

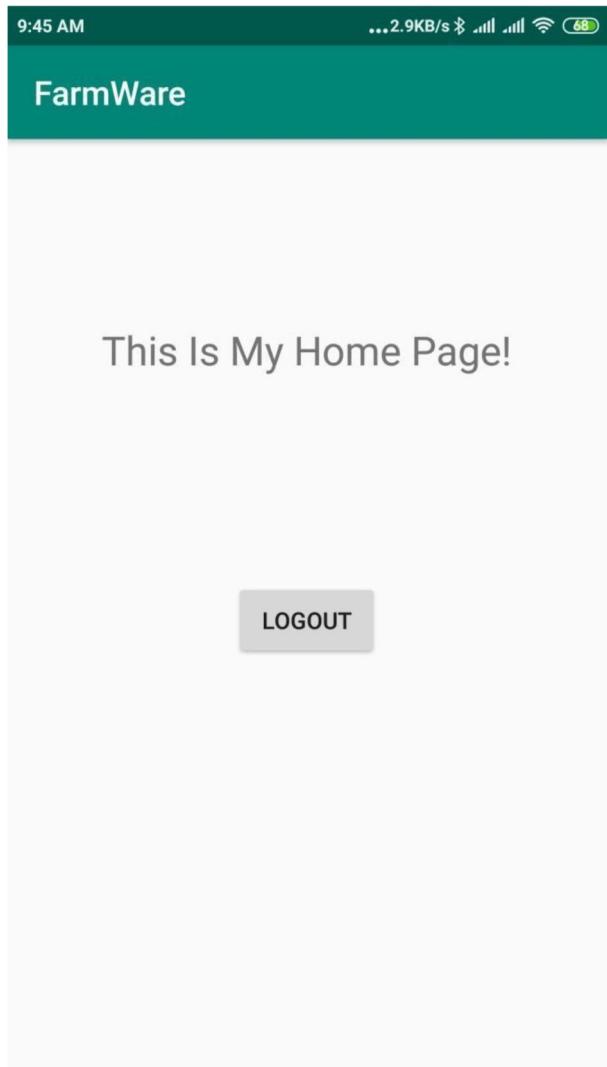

The screenshot shows the Android Studio interface with the project 'FarmWare' open. The main window displays the Java code for `MainActivity.java`. The code initializes Firebase Auth and sets up a button click listener for logging out:

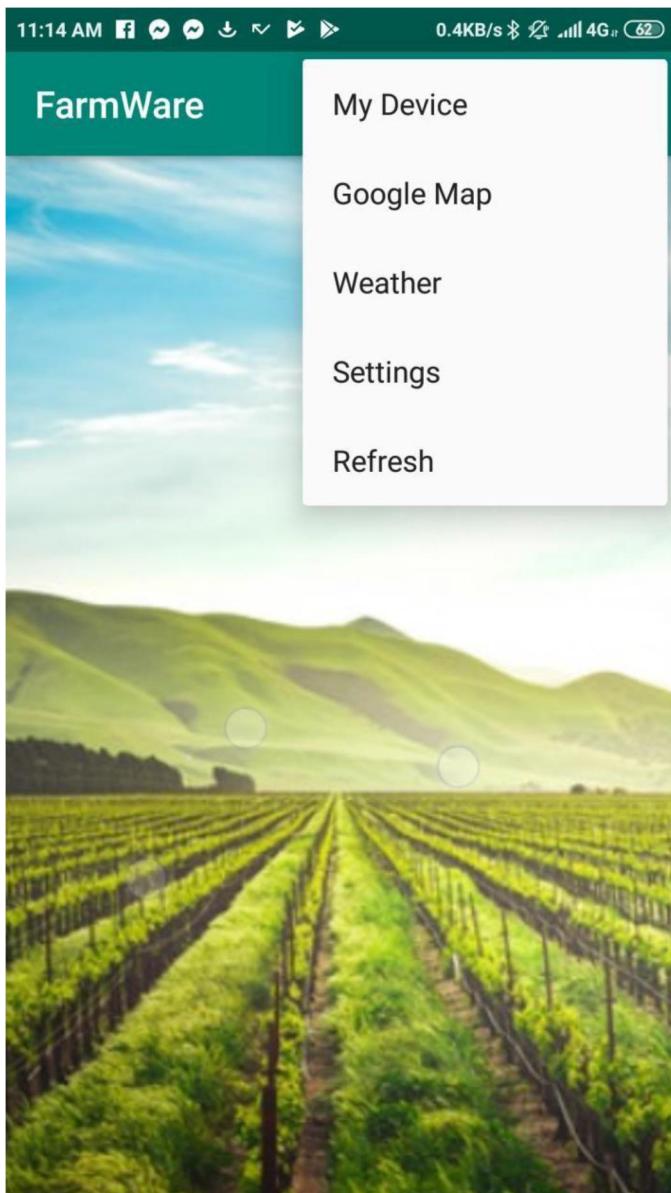

```
1 package com.example.farmware;
2
3 import ...
4
5 public class MainActivity extends AppCompatActivity {
6
7     private FirebaseAuth firebaseAuth;
8     private Button logout;
9
10    @Override
11    protected void onCreate(Bundle savedInstanceState) {
12        super.onCreate(savedInstanceState);
13        setContentView(R.layout.activity_main);
14
15        firebaseAuth = FirebaseAuth.getInstance();
16
17        logout = (Button)findViewById(R.id.btnExit);
18
19        logout.setOnClickListener(new View.OnClickListener() {
20            @Override
21            public void onClick(View view) {
22                firebaseAuth.signOut();
23                finish();
24                startActivity(new Intent(getApplicationContext(), LoginActivity.class));
25            }
26        });
27    }
28}
```

Google weather:

Weather Coding & Console Design:

The screenshot shows the Android Studio interface with the WeatherActivity.java file open in the code editor. The code defines a WeatherActivity class that extends AppCompatActivity. It initializes five TextViews (t1_temp, t2_city, t3_description, t4_date, t5_c) and sets their text colors and sizes. The build log at the bottom indicates a successful build.

```
1 package com.example.firmware;
2
3 import ...
4
5 public class WeatherActivity extends AppCompatActivity {
6
7     TextView t1_temp, t2_city, t3_description, t4_date, t5_c;
8
9     @Override
10    protected void onCreate(Bundle savedInstanceState) {
11        super.onCreate(savedInstanceState);
12        setContentView(R.layout.activity_weather);
13
14        t1_temp = (TextView) findViewById(R.id.textView3);
15        t2_city = (TextView) findViewById(R.id.textView4);
16        t3_description = (TextView) findViewById(R.id.textView6);
17        t4_date = (TextView) findViewById(R.id.textView2);
18        t5_c = (TextView) findViewById(R.id.textView5);
19
20        t1_temp.setTextColor(Color.WHITE);
21        t1_temp.setTextSize(40);
22
23        t2_city.setTextColor(Color.WHITE);
24        t2_city.setTextSize(20);
25
26        t3_description.setTextColor(Color.WHITE);
27        t3_description.setTextSize(20);
28
29        t4_date.setTextColor(Color.WHITE);
30        t4_date.setTextSize(20);

Project Description and Discussion

Our project has the following features and the objectives of our project is given below:

Features:

1. The sensors are designed to get the data readings of a particular area.
2. This data will be available on the app easily and quickly.
3. The data can be accessed from anywhere.
4. The data's will be saved on the database so, it will be easy to get the data.

Objectives:

1. As the project is based on greenhouse it will be easy to maintain the weather.
2. The farmers will easily be notified about the conditions of that region.
3. It will make life easy.

We have collected dataset using marigold flower plant. And using these dataset we implemented our machine learning part. That is how to detect the growth of the plants.

Poster:

FARM-WARE

Department of Electrical and Computer Engineering, North South University
Group Member: Tahmin Ali, Juloyer Uddin, Md. Fahad Hasan Chowdhury, Md. Shohab Islam
Supervision: Dr. Dihen Md Nuruddin Hasan

Background:

Farm-Ware is designed basically for the farmers to get enough information about the Temperature, humidity, soil moisture, plant growth rate etc. of a particular area. Many farmers can't access the facility of the digital services related to agriculture using smart devices. So, Project Farm-Ware is based on this context to provide information collected by Hardware tools and served by easy interface presenting the information only. Farm ware is also included with website and smartphone application to spread the collected information.

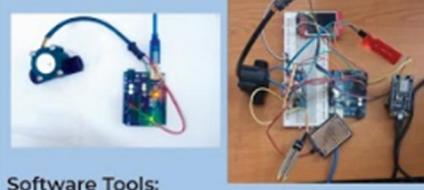

Features:

1. We are taking data through the sensors using IOT.
2. The data's that we get from the sensors will be stored in firebase.
3. The app is designed to view the data's and the plant growth rate of that area.
4. We have implemented ML to detect the plant growth rate.
5. We used KNN to detect plant growth rate as KNN

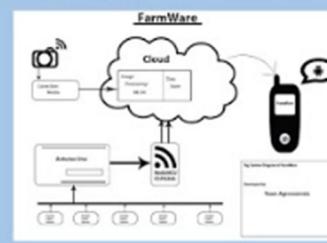

Android App:

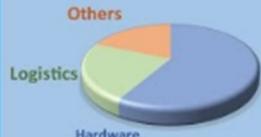

Hardware Equipment's:

System Diagram:

Budget and Cost:

- Majority part is the cost of the hardware materials.
- Total Cost is around 6000 BDT.
- Per unit cost is 1500 BDT.

Conclusion:

Our device and the app is very useful, especially for the farmers. Which helps them to get their needed data and information quickly also they can get to know about the plant growth rate. It will help them to ease their life and do their agriculture work perfectly as they are getting all the information about the weather and the soil and also the growth of the plants.

Future Plan:

We will further develop our app and the device in such a way that the farming equipment's can also be controlled from anywhere. We are working on our project to develop it to that level and make it very useful.

Software Tools:

Lesson Learnt

While starting this project we thought that it would be easy to complete this project but then we realized it is really tough. So, we have learnt a lot of lessons while solving this problem.

- We learnt python to code for ML.
- We knew the basics of android development but for this problem we learnt many more things about android development.
- We learnt how to implement machine learning.

Timeline

SL	Deliverable	WEEK					Man-Week
		4	8	12	16	20	
1	Front end development						10
2	Hardware implementation						10
3	Database management						6
4	Testing & debugging						4
5	Machine learning						4
6	Deployment and final release						4
Total duration							18

Team Dynamics

	Hardware Part (Aurdino)			
1	Temperature sensor	will determine the temp. of an area	week-1	Shohaib Islam
3	Humidity sensor	will determine the humidity of the air	week-2	Shohaib Islam
4	Water level	it will determine the water level	week-3	Tahmim
5	Water flow	determine how much water will flow	week-4	Tahmim
6	Soil moisture	determine the moisture of the soil	week-5	Fahad Hassan
7	Rain Drop	determine the amount of rain	week-6	Jubayer
	Software Part			
8	Starting page (Android app)	the opening page of the app	week-7	Jubayer
9	Login page	login will be required for a user profile	week-7	Fahad Hasan
10	Registration page	to register a new profile	week-7	Tahmim
11	Main page	it will contain the info's	week-8	Jubayer
12	Google Location	it will take the location	week-9	Jubayer
13	Google API	to access the google map	week-9	Tahmim
14	Database	will store the values from sensors	week10-11	Shohaib Islam
15	Dataset		week-12	Jubayer, Shohaib
16	ML Implementation	Will determine plant growth rate	week 13-17	Tahmim, Fahad Hasan
	Final Demo		week 18	

Conclusion

Our device and the app is very useful, especially for the farmers. Which helps them to get their needed data and information quickly. It will help them to ease their life and do their agriculture work perfectly as they are getting all the information about the weather and the soil. We will further develop our app and the device in such a way that the farming equipment's can also be controlled from anywhere also we are planning to implement a camera on the spot which will take few snaps automatically and will detect the growth rate of the plants on a weekly basis. We are working on our project to develop it to that level and make it very useful.
